

**AMENDMENTS**

**In the Specification:**

Please replace the stated paragraph within the specification with the following paragraph:

[0054] Figure [[11]] 10 is a view of some of the details of the universal adaptor/receiver 66.

Shown, are inputs for the four limb electrodes as well as inputs for the precordial cable. A wireless switch 80 is shown for switching the unit from wireless to wired operation. Also shown, is an antenna 82 for receiving a wireless signal from the precordial pad of the invention.

The antenna 82 is connected to a receiver 84 that receives, processes, and transmits the information from the precordial pad to outlet jacks 86. Outlet jacks 86 are available for connection to the EKG machine. This would typically be by a wired connection, but using wireless technology for this connection would also be possible. Thermometer window 70 is also shown.
